

COS20019 - Cloud Computing Architecture

# Week 3: ACA Module 11 Guided Lab - Streaming Dynamic Content using Amazon CloudFront

Author: Trac Duc Anh Luong - ID: 103488117

Due Date: 24/09/2023

## Task 1: Lab Preparation

In this lab, you will be using a sample video file to configure a dynamic stream. For your convenience, an Amazon Simple Storage Service (Amazon S3) bucket has already been created.

5. In the AWS Management Console, on the **Services** menu, choose **S3**.  
An S3 bucket containing the string *awstrainingreinvent* should be present. Note the Region that the bucket is in, and open the bucket.

	Name ▲	AWS Region ▼	Access ▼	Creation date ▼
<input type="radio"/>	c92520a206 1454l48022 13t1w0780- awstrainingr einvent- 1j2nvnobd4 tvb	US East (N. Virginia) us- east-1	 <b>Public</b>	September 21, 2023, 20:16:48 (UTC+07:00)

6. Open the **input** folder. It contains a video file named **AmazonS3Sample.mp4**.  
**Note:** From the time you log in to the Amazon S3 console, it can take up to ten minutes for the file to appear in the S3 bucket. If you do not see it, select the circular arrow icon on the upper right of the screen to refresh the contents of the bucket.

<input type="checkbox"/>	Name ▲	Type ▼	Last modified ▼	Size ▼	Storage class ▼
<input type="checkbox"/>	 AmazonS3Sa mple.mp4	mp4	September 21, 2023, 20:18:02 (UTC+07:00)	22.4 MB	Standard

## Task 2: Create an Amazon CloudFront Distribution

In this task, you will create an Amazon CloudFront distribution that will be used to deliver the multiple bit-rate files generated by Amazon Elastic Transcoder to end-user devices.

7. On the **Services** menu, choose **CloudFront**.
8. Choose **Create a CloudFront distribution**.

### Get started with CloudFront

Enable accelerated, reliable and secure content delivery for Amazon S3 buckets, Application Load Balancers, Amazon API Gateway APIs, and more in 5 minutes or less.

Create a CloudFront distribution

9. Under **Origin Settings** section of the page, enter the follow information:
  - Select the **Origin domain** field. A list of S3 buckets will appear. Choose the one that was created earlier that has **awstrainingreinvent** as part of the file name.
  - Leave **Origin access** as **Public**.

#### Origin

##### Origin domain

Choose an AWS origin, or enter your origin's domain name.

Q c92520a2061454l4802213t1w0780-awstrainingreinvent-1j2nvnobd4tvb.s3.us-east-1.ama X

##### Origin path - optional [Info](#)

Enter a URL path to append to the origin domain name for origin requests.

Enter the origin path

##### Name

Enter a name for this origin.

c92520a2061454l4802213t1w0780-awstrainingreinvent-1j2nvnobd4tvb.s3.us-east-1.amazonaws

##### Origin access [Info](#)

☒ Public

Bucket must allow public access.

☐ Origin access control settings (recommended)

Bucket can restrict access to only CloudFront.

☐ Legacy access identities

Use a CloudFront origin access identity (OAI) to access the S3 bucket.

- Under **Web Application Firewall (WAF)** select **Do not enable security protections**.

**Web Application Firewall (WAF)**

☐ **Enable security protections**  
Keep your application secure from the most common web threats and security vulnerabilities using AWS WAF. Blocked requests are stopped before they reach your web servers.

☒ **Do not enable security protections**  
Select this option if your application does not need security protections from AWS WAF.

10. The warning message under **Custom SSL certificate - optional** can be safely ignored.

**Custom SSL certificate - optional**  
Associate a certificate from AWS Certificate Manager. The certificate must be in the US East (N. Virginia) Region (us-east-1).

Choose certificate ▼

[Request certificate](#)

⚠ User: arn:aws:sts::078010345607:assumed-role/voclabs/user2752985=103488117@student.swin.edu.au is not authorized to perform: acm:ListCertificates because no identity-based policy allows the acm:ListCertificates action

11. Scroll to the bottom of the page, then choose **Create Distribution**.

✔ Successfully created new distribution. ✕

[CloudFront](#) > [Distributions](#) > E3I6AML5YKAZSA

E3I6AML5YKAZSA

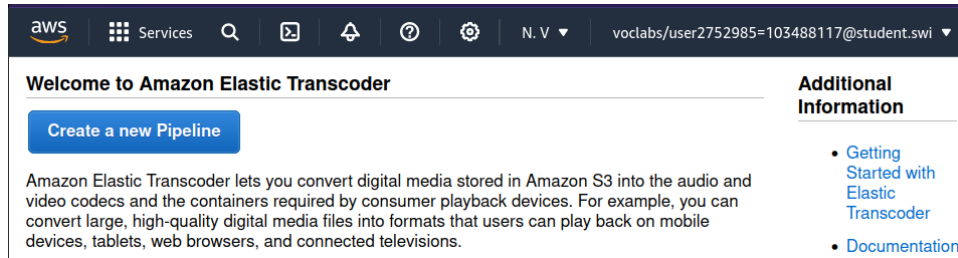

View metrics

## Task 3: Create an Amazon Elastic Transcoder Pipeline

### Create a Pipeline

In this section, you will create a pipeline that will manage the jobs to transcode the input file.

11. In the AWS Management Console, on the **Services** menu, choose **Elastic Transcoder**.

12. In the navigation bar of the Amazon Elastic Transcoder console, select the same Region that the S3 bucket was created in.
13. On the Pipelines page, choose **Create a new Pipeline**.
14. For **Pipeline Name**, enter **InputPipeline**
15. For **Input Bucket**, select the **awstrainingreinvent** S3 bucket.
16. For **IAM Role**, under **Other roles**, select **AmazonElasticTranscoderRole**. This is a role that was pre-created in this lab's CloudFormation template that uses the managed policy AmazonElasticTranscoderRole. The Elastic Transcoder service will assume this role to access Amazon S3 and Amazon Simple Notification Service (Amazon SNS) resources in your lab account.

#### Create New Pipeline

A pipeline is a queue for your transcoding jobs. You can have more than one pipeline per AWS account. You can use multiple pipelines to organize your transcoding workflow, for example, by having one pipeline for standard-priority jobs and one for high-priority jobs.

Pipeline Name	<input type="text" value="InputPipeline"/>	
Input Bucket	<input type="text" value="c92520a206145414802213t1w0780-i"/>	
IAM Role	<input type="text" value="AmazonElasticTranscoderRole"/>	

This role must have the permissions necessary to access the applicable S3 buckets and SNS topics. [View the policy for the default IAM role.](#)

17. In the **Configuration for Amazon S3 Bucket for Transcoded Files and Playlists** section, enter the follow information:
  - Under **Bucket**, select the **awstrainingreinvent** S3 bucket.
  - Under **Storage Class**, select **Standard**.

#### Configuration for Amazon S3 Bucket for Transcoded Files and Playlists

Bucket	<input type="text" value="c92520a206145414802213t1w0780-i"/>	
Storage Class	<input type="text" value="Standard"/>	

18. In the **Configuration for Amazon S3 Bucket for Thumbnails** section, enter the following information:
  - Under **Bucket**, select the **awstrainingreinvent** S3 bucket.
  - Under **Storage Class**, select **ReducedRedundancy**.

Name: Trac Duc Anh Luong - ID: 103488117

#### Configuration for Amazon S3 Bucket for Thumbnails

Bucket	<input type="text" value="c92520a2061454l4802213t1w0780-i"/>	
Storage Class	<input type="text" value="Reduced Redundancy"/>	

#### 19. Choose **Create Pipeline**.

##### ▼ Summary

ARN	arn:aws:elastictranscoder:us-east-1:078010345607:pipeline/1695303159980-pdb0f5
Name	InputPipeline
Pipeline ID	1695303159980-pdb0f5
Status	Active
Input Bucket	c92520a2061454l4802213t1w0780-awstrainingreinvent-1j2nvnobd4tvb

## Create a Job

In this section, you will create a job under the Amazon Elastic Transcoder pipeline that was just created. The job does the work of transcoding the input file into multiple bit-rates as selected.

20. On the Pipelines page, choose **Create New Job** to create a transcoding job. You create the job in the pipeline (queue) that you want to use to transcode the video file.

21. For **Pipeline**, select **InputPipeline**.

22. For **Output Key Prefix**, enter **output/**.

Amazon Elastic Transcoder will prepend this value to the names of all files that the job will create (including output files, thumbnails, and playlists).

23. For **Input Key**, select the input file labeled **input/AmazonS3Sample.mp4**.

#### Create a New Transcoding Job

A job contains all of the information that Elastic Transcoder needs to transcode one media file into another format. When you create a job, it's automatically added to the pipeline that you specify.

Pipeline	<input type="text" value="InputPipeline"/>	
Output Key Prefix	<input type="text" value="output/"/>	

#### Input Details (1 of 1)

Input Key	<input type="text" value="input/AmazonS3Sample.mp4"/>	
-----------	---	--

## Configure Output Details

The settings in this section will determine how many output files (bit-rates) are created. You will configure three output files for this demo having three separate bit-rates (2Mbps, 1.5Mbps and 1Mbps).

Name: Trac Duc Anh Luong - ID: 103488117

Each output bit-rate will require you to create a separate output details section. This will also output a playlist file for each bit-rate, which lists all the segments that make up the stream.

24. For **Preset**:, select **System preset: HLS 2M**

25. For **Segment Duration**, enter **10** (which is the HLS default).

26. For **Output Key**, enter the unique prefix **HLS20M** to name the segments created using this preset.

**Output Details (1 of 3)** [- Remove Output](#)

Preset

System preset: HLS 2M

Segment Duration

10

Output Key

HLS20M

Segment Filename Preview

HLS20M00000.ts

27. Click + **Add Another Output** and repeat the steps above to generate segments for presets **HLS 1.5M** and **HLS 1M** and then provide the respective prefix names:

- **HLS15M**
- **HLS10M**

**Output Details (2 of 3)** [- Remove Output](#)

Preset

System preset: HLS 1.5M

Segment Duration

10

Output Key

**Output Details (3 of 3)** [- Remove Output](#)

Preset

System preset: HLS 1M

Segment Duration

10

Output Key

HLS10M

Segment Filename Preview

HLS10M00000.ts

Caution: Do not create the job yet! Instead, complete the next few steps in this lab which will have you add a playlist to the job.

## Configure a Playlist

Name: Trac Duc Anh Luong - ID: 103488117

The playlist will combine all the individual bit-rate playlists and provide a single URL for the devices to playback the stream. To configure a playlist, do the following:

28. Under **Playlists (Adaptive Streaming)**, choose **Add Playlist**, then configure:
  - **Master Playlist Name** **primary**
  - **Playlist Format:** *HLSv3*
29. Select all the three outputs, which were entered in the previous section, to include them in this playlist by selecting the + option.

## Task 4: Test Playback of the Dynamic (Multi Bit-Rate) Stream

In this module, you will test the playback of the dynamic stream generated in the previous section using an iOS or Android device. You can also use an Android 4.x device to test the below exercise.

**Note:** Certain browsers may not support this feature. Use the default web browser in the device to test.

### Construct the Playback URL

Name: Trac Duc Anh Luong - ID: 103488117

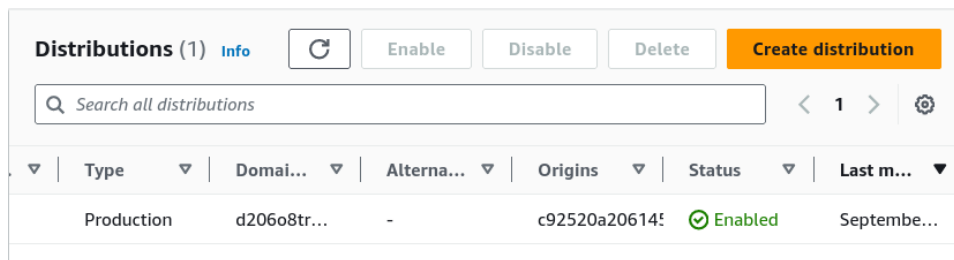

The playback URL that plays through Amazon CloudFront is comprised of two components:

- Amazon CloudFront domain name
- Path of the playlist file in the S3 bucket (output generated by Elastic Transcoder):
- `http://<CloudFront domain name>/<playlist file path in Amazon S3 bucket>`

## Obtain an Amazon CloudFront Domain Name

To obtain an Amazon CloudFront domain name:

31. In the AWS Management Console, on the **Services** menu, choose **CloudFront**.
32. Select the **Amazon CloudFront** distribution that was previously created, and verify that the **Status** has changed from *InProgress* to *Enabled*.

33. Proceed to the next step only after the **Status** changes to *Enabled*.
34. Select the Distribution and under **Settings**. Copy the **Distribution domain name** and paste it into a text editor.

**`https://d206o8tr26vrnb.cloudfront.net`**

## Obtain the Playlist File Path

To obtain the playlist file path:

35. On the **Services** menu, choose **S3**.
36. Select the **awstrainingreinvent** S3 bucket.
37. Open the **output** folder (which contains the output of the transcoding job) and select the **primary.m3u8** playlist file.

This is the file that you will play on your mobile device.

Next, you must create the URL to the file from CloudFront.

		September 21, 2023, 20:44:00 (UTC+07:00)			
<input type="checkbox"/>	 <a href="#">primary.m3u8</a>	m3u8	340.0 B	Standard	

38. In a text editor, construct the URL by appending `/output/primary.m3u8` to the end of your CloudFront domain name.

The new URL should look similar to: `d1ckwesahkbyvu.cloudfront.net/output/primary.m3u8`

**`https://d206o8tr26vrnb.cloudfront.net/output/primary.m3u8`**

39. Type the URL into the default browser of an iOS or Android device. If you do not have a mobile device available, type the URL into a browser on your computer.

**Be aware that standard data rates may apply when playing the video on a mobile device.**

40. The stream should start playing on your device and dynamically request the relevant segments based on your bandwidth and CPU conditions.

You have learned how to use AWS services such as Amazon S3, Amazon Elastic Transcoder, and Amazon CloudFront together to deliver HLS media files to iOS or Android devices.

You have successfully:

- Learned the basic concepts and terminology of the Amazon Elastic Transcoder and Amazon CloudFront services.
- Created your own Amazon Elastic Transcoder pipeline and Amazon CloudFront distribution.
- Used Amazon Elastic Transcoder to transcode a video file into different HLS formats and distributed it to remote devices using Amazon CloudFront.

Name: Trac Duc Anh Luong - ID: 103488117

All tasks completed.

#### Submission Report

[Executed at: Thu Sep 21 6:52:49 PDT 2023]

```
Testing report - A CloudFront distribution was created.
Testing report - The Pipeline was created.
Testing report - The correct storage class was chosen for Transcoded Files and Playlists.
Testing report - The correct storage class was chosen for Thumbnails.
Testing report - The Output Key Prefix is correct
Testing report - All of the selected presets are correct.
Testing report - The correct Playlist Format was selected.
Testing report - The expected outputs were found for the Playlist.
